

Sherlock and Anagrams

Given a string S , find the number of "unordered anagrammatic pairs" of substrings.

Input Format

First line contains T , the number of testcases. Each testcase consists of string S in one line.

Constraints

$1 \leq T \leq 10$

$2 \leq \text{length}(S) \leq 100$

String S contains only the lowercase letters of the English alphabet.

Output Format

For each testcase, print the required answer in one line.

Sample Input#00

```
2
abba
abcd
```

Sample Output#00

```
4
0
```

Sample Input#01

```
5
ifailuhkqq
hucpoltgty
ovarjsnrbf
pvmupwjijf
iwwhrlkpek
```

Sample Output#01

```
3
2
2
6
3
```

Explanation

Sample00

Let's say $S[i,j]$ denotes the substring S_i, S_{i+1}, \dots, S_j .

testcase 1:

For $S = \text{abba}$, anagrammatic pairs are: $\{S[1,1], S[4,4]\}$, $\{S[1,2], S[3,4]\}$, $\{S[2,2], S[3,3]\}$ and $\{S[1,3], S[2,4]\}$.

testcase 2:

No anagrammatic pairs.

Sample01

Left as an exercise to you.
