

# Super Maximum Cost Queries

Victoria has a tree,  $T$ , consisting of  $N$  nodes numbered from  $1$  to  $N$ . Each edge from node  $U_i$  to  $V_i$  in tree  $T$  has an integer weight,  $W_i$ .

Let's define the cost,  $C$ , of a path from some node  $X$  to some other node  $Y$  as the maximum weight ( $W$ ) for any edge in the unique path from node  $X$  to node  $Y$ .

Victoria wants your help processing  $Q$  queries on tree  $T$ , where each query contains  $2$  integers,  $L$  and  $R$ , such that  $L \leq R$ . For each query, she wants to print the number of different paths in  $T$  that have a cost,  $C$ , in the inclusive range  $[L, R]$ .

It should be noted that path from some node  $X$  to some other node  $Y$  is considered same as path from node  $Y$  to  $X$  i.e  $\{X,Y\}$  is same as  $\{Y,X\}$ .

## Input Format

The first line contains  $2$  space-separated integers,  $N$  (the number of nodes) and  $Q$  (the number of queries), respectively.

Each of the  $N-1$  subsequent lines contain  $3$  space-separated integers,  $U$ ,  $V$ , and  $W$ , respectively, describing a bidirectional road between nodes  $U$  and  $V$  which has weight  $W$ .

The  $Q$  subsequent lines each contain  $2$  space-separated integers denoting  $L$  and  $R$ .

## Constraints

- $1 \leq N, Q \leq 10^5$
- $1 \leq U, V \leq N$
- $1 \leq W \leq 10^9$
- $1 \leq L \leq R \leq 10^9$

## Scoring

- $1 \leq N, Q \leq 10^3$  for  $30\%$  of the test data.
- $1 \leq N, Q \leq 10^5$  for  $100\%$  of the test data.

## Output Format

For each of the  $Q$  queries, print the number of paths in  $T$  having cost  $C$  in the inclusive range  $[L, R]$  on a new line.

## Sample Input

```
5 5
1 2 3
1 4 2
2 5 6
3 4 1
1 1
1 2
2 3
2 5
1 6
```

## Sample Output

```
1
3
5
5
10
```

## Explanation

$Q_1$ : {3, 4}

$Q_2$ : {1, 3}, {3, 4}, {1, 4}

$Q_3$ : {1, 4}, {1, 2}, {2, 4}, {1, 3}, {2, 3}

$Q_4$ : {1, 4}, {1, 2}, {2, 4}, {1, 3}, {2, 3}

...etc.
